

## Forklift Fork Positioners

Fork Positioner for Forklifts - A fork positioner is actually an apparatus constructed out of high quality materials intended to endure the most challenging procedures and work environments. This piece of equipment can enable the individual driving to control the blades hydraulically without leaving the seat. Side shifting models have the added ability to laterally position the arms or the entire load in order to facilitate more accurate carrying and placement in a quicker and much more effective way.

The fork pocket is somewhat unique and can enable the one operating it to safely swing the forks into position without any fear of damaging the positioning cylinders. This could allow the operator the choice to be able to perform independent or simultaneous fork movement, dependent upon the job requirement. For most forklifts with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages could be transformed into blade positioners on existing units.
